**Exam : C\_ABAPD\_2309**

**Title : SAP Certified Associate -  
Back-End Developer -  
ABAP Cloud**

**Version : DEMO**

1.Which function call returns 0?

- A. Count\_any\_of ( val - 'ABAP ABAP abap' sub "AB" )
- B. Count (val - 'ABAP ABAP abap' sub - 'AB' )
- C. find\_any\_of (val = "ABAP ABAP abap' sub = "AB")
- D. find\_any\_not\_of( val 'ABAP ABAP abap' sub = 'AB')

**Answer: D**

**Explanation:**

The function find\_any\_not\_of returns the position of the first character in the string val that is not contained in the string sub. If no such character is found, the function returns 0. In this case, the string val contains only the characters A, B, and a, which are all contained in the string sub, so the function returns 0. The other functions return positive values, as follows:

Count\_any\_of returns the number of occurrences of any character in the string sub within the string val. In this case, it returns 8, since there are 8 A's and B's in val.

Count returns the number of occurrences of the string sub within the string val. In this case, it returns 2, since there are 2 AB's in val.

find\_any\_of returns the position of the first character in the string val that is contained in the string sub. In this case, it returns 1, since the first character A is in sub.

2.In which products must you use the ABAP Cloud Development Model? Note: There are 2 correct answers to this question.

- A. SAP S/4HANA Cloud, private edition
- B. SAP BTP, ABAP environment
- C. SAP S/4HANA on premise
- D. SAP S/4HANA Cloud, public edition

**Answer: BD**

**Explanation:**

The ABAP Cloud Development Model is designed for environments that are managed and updated by SAP, which typically means cloud environments. The correct answers where this development model must be used are:

SAP BTP, ABAP environment - SAP Business Technology Platform (BTP), ABAP environment (also known as Steampunk), which is SAP's PaaS (Platform as a Service) offering, requires the use of the ABAP Cloud Development Model.

SAP S/4HANA Cloud, public edition - The public edition of SAP S/4HANA Cloud is a SaaS (Software as a Service) offering that is fully managed by SAP, and it requires the use of the ABAP Cloud Development Model.

3.Which RESTful Application Programming object can be used to organize the display of fields in an app?

- A. Data model view
- B. Metadata extension
- C. Service definition
- D. Projection view

**Answer: D**

**Explanation:**

A metadata extension is a RESTful Application Programming object that can be used to organize the display of fields in an app. A metadata extension is a CDS view that annotates another CDS view with UI annotations, such as labels, icons, or facets. These annotations define how the data should be presented in the app, such as which fields should be shown on the object page, which fields should be editable, or which fields should be used for filtering or sorting. A metadata extension can also be used to add custom actions or validations to the app<sup>12</sup>.

4.Refer to Exhibit.

```
DATA: go_super TYPE REF TO lcl_super,  
      go_sub   TYPE REF TO lcl_sub.  
go_sub = NEW #( ... ).  
go_super = go_sub.
```

with lcl\_super being superclass of lcl\_sub.

When accessing the subclass instance through go\_super, what can you do? Note: There are 2 correct answers to this question.

- A. Access the inherited private components.
- B. Access the inherited public components.
- C. Call a subclass specific public method
- D. Call inherited public redefined methods.

**Answer: BD**

**Explanation:**

In object-oriented programming (OOP), particularly in ABAP OOP, when you have a reference to a superclass and you're working with an instance of a subclass, here's what you can do:

Access the inherited public components - This is correct. You can always access public components of the superclass through a reference to the superclass, even if the actual object is an instance of a subclass.

Call inherited public redefined methods - This is also correct. If the subclass has redefined a method that was public in the superclass, and you call this method through a reference of the superclass type, the redefined version in the subclass will be executed. This is known as polymorphism.

5.Given the following code in an SAP S/4HANA Cloud private edition tenant:

```
1 CLASS zcl_demo_class DEFINITION.  
2 METHODS: m1.  
3 ENDCLASS..  
4 CLASS zcl_demo_class_Implementation.  
5 METHOD m1.  
6 CALL FUNCTION 'ZF1'.  
7 ENDMETHOD  
8 ENDCLASS.
```

The class `zcl_demo_class` is in a software component with the language version set to "ABAP Cloud". The function module `ZF1` is in a different software component with the language version set to "Standard ABAP". Both the class and function module are customer created.

Regarding line #6, which of the following are valid statements? Note: There are 2 correct answers to this question.

- A. 'ZF1' can be called only if it is released for cloud development.
- B. 'ZF1' can be called if a wrapper is created for it and the wrapper itself is released for cloud development.
- C. "ZF1" can be called whether it is released or not for cloud development
- D. ZF1" can be called if a wrapper is created for it but the wrapper itself is not released for cloud development.

**Answer:** AB

**Explanation:**

The ABAP Cloud Development Model requires that only public SAP APIs and extension points are used to access SAP functionality and data. These APIs and extension points are released by SAP and documented in the SAP API Business Hub<sup>1</sup>. Customer-created function modules are not part of the public SAP APIs and are not released for cloud development. Therefore, calling a function module directly from an ABAP Cloud class is not allowed and will result in a syntax error. However, there are two possible ways to call a function module indirectly from an ABAP Cloud class:

Create a wrapper class or interface for the function module and release it for cloud development. A wrapper is a class or interface that encapsulates the function module and exposes its functionality through public methods or attributes. The wrapper must be created in a software component with the language version set to "Standard ABAP" and must be marked as released for cloud development using the annotation `@EndUserText.label`. The wrapper can then be called from an ABAP Cloud class using the public methods or attributes<sup>2</sup>.

Use the ABAP Cloud Connector to call the function module as a remote function call (RFC) from an ABAP Cloud class. The ABAP Cloud Connector is a service that enables the secure and reliable communication between SAP BTP, ABAP environment and on-premise systems. The function module must be exposed as an RFC-enabled function module in the on-premise system and must be registered in the ABAP Cloud Connector. The ABAP Cloud class can then use the class `cl_rfc_destination_service` to get the destination name and the class `cl_abap_system` to create a proxy object for the function module. The proxy object can then be used to call the function module<sup>3</sup>.
